

BUG Lack of validation in email field on workspace invitation

Bug ID: Workspace-001 **Title:** Unrealistically long email input in workspace invitation breaks UI layout and shifts action elements out of view.

Priority: Medium
Severity: Medium

Reported By: Demirhan Yalcin
Date: 22/03/2026
Environment: Chrome 122, Windows 10, Desktop

Description

On inviting somebody new into the workspace, the email field does not validate input length. This allows entering unrealistically long email addresses which breaks the UI layout, causing right-side elements such as Status and Actions to shift out of the visible viewport, requiring horizontal scrolling to access them.

Steps to Reproduce

1. Open navigation bar.
2. Click "Invite collaborators" button located in the bottom of the navigation bar.
3. Click "+ Invite" button located in right top of the screen with black background.
4. Write email address which is validly containing all necessary elements such as '@', '.com'. However keep the domain part really long.
5. Select organization role of the user. e.g "Organization Admin"
6. Select workspace you want to invite this person.
7. Select workspace role of this person. e.g "Product Manager"
8. Click "Send Invite" button located in right bottom of the modal screen.

Expected Behavior

The application should not allow sending invitations to email addresses exceeding the 320 character maximum defined by official email documentation. Input length should be validated on the frontend before submission.

Actual Behavior

The application accepts and sends invitations to impossibly long email addresses. This causes UI elements including Status and Actions columns to shift far to the right, making them inaccessible without horizontal scrolling.

Impact

- **User Experience:** Users cannot see critical functionalities such as Actions after a long email is entered. These functionalities allow admins to remove or resend invitations and should always be visible on screen.
- **Functionality:** Critical action buttons such as Remove and Resend become hidden from view, preventing admins from managing pending invitations without horizontal scrolling.

Evidence
