

BUG Persona Textfield Validation

Bug ID: Persona-001 **Title:** There is no frontend validation in description and title on persona create/edit.

Priority: ?

Severity: High

Reported By: Demirhan Yalcin

Date: 12/03/2026

Environment: Chrome 122, Windows 10, Desktop

Description

Persona **title** and **description** fields do not have frontend validation for input length. It is possible to paste extremely large text values into these fields and submit them successfully through the API request.

During testing, a very large text (multiple MBs) was inserted into the **title** field and sent through the `UpdatePersona` API request to `api.theydo.com`. The request was accepted and processed without any restriction.

This behavior allows users to send extremely large payloads which may cause performance degradation or unexpected behavior in the application.

Steps to Reproduce

1. Navigate to **Building blocks** → **Personas**
2. Create a new persona or edit an existing persona
3. Edit the **description** or **title** field
4. Go to a lorem ipsum generator and copy a very large amount of text (e.g., ~10,000 paragraphs)
5. Paste the text into the **title** or **description** field
6. Save the persona
7. Open **Network tab** → `api.theydo.com` and observe the payload size in the request

Expected Behavior

The application should implement frontend validation to prevent extremely large input values from being submitted in the **title** and **description** fields.

Actual Behavior

The application allows extremely large text to be pasted and submitted without any validation. The API request is sent with a very large payload.

Impact

- **User Experience:** After creating a persona with an extremely large **title/description**, the personas page may fail to load or becomes very slow.
- **Performance:** Large payloads sent through the API may cause unnecessary load on the backend and affect system performance.
