

BUG Registration Page Password Field Validation

Bug ID: Registration-001 **Title:** Password field accepts input beyond the documented 72 character maximum without validation error

Priority: ? **Severity:** Medium

Reported By: Demirhan Yalcin **Date:** 18/03/2026 **Environment:** Chrome 122, Windows 10, Desktop

Description

The password field on the registration page does not enforce the documented 72 character maximum length. The validation message clearly states "**Password should be 8-72 characters long**" but passwords exceeding 72 characters are accepted without any error or restriction. This behavior creates a mismatch between the documented rule and the actual enforced limit, which may cause unexpected behavior on the backend.

Steps to Reproduce

1. Navigate to the registration page
2. Enter a valid email address
3. Enter a password of 73 or more characters that meets all other requirements
4. Observe the password validation message

Expected Behavior

The application should display a validation error stating "Password should be 8-72 characters long" when the input exceeds 72 characters.

Actual Behavior

No validation error appears and the field accepts the input successfully beyond the documented maximum limit.

Impact

- **User Experience:** The validation message visible to the user is misleading as it states a limit that is not actually enforced.
- **Security:** Accepting passwords beyond the documented limit may cause unexpected truncation or handling on the backend without the user's knowledge.
