

# BUG Registration Page Validation

**Bug ID:** Registration-002 **Title:** Password validation error incorrectly triggers when only the email field contains invalid input

**Priority:** ? **Severity:** Medium

**Reported By:** Demirhan Yalcin

**Date:** 18/03/2026

**Environment:** Chrome 122, Windows 10, Desktop

## Description

On the registration page, entering an invalid email address with a valid password triggers validation errors on both fields simultaneously. Only the email validation error should appear in this scenario. This behavior is misleading to the user as it incorrectly signals that the password is also invalid when it is not.

## Steps to Reproduce

1. Navigate to the registration page
2. Enter an invalid email address into the email field
3. Enter a valid password that meets all requirements into the password field
4. Observe the validation error messages

## Expected Behavior

Only the email validation error should appear indicating the email address is invalid. The password field should show no validation error.

## Actual Behavior

Both the email and password validation errors appear simultaneously even though the password input is valid.

## Impact

- **User Experience:** Users are incorrectly informed that their password is invalid when it meets all requirements, which creates confusion during registration.
- **Reliability:** Validation logic is not isolated per field, which suggests the error handling between fields is incorrectly coupled.

## Evidence
