

TEST Registration Page Validation

Test Case ID: Registration-002 **Title:** Verify password field does not trigger validation error when only the email field contains invalid input.

Feature: Registration / Field Validation **Type:** Functional, Negative **Priority:** Medium **Status:** Fail

Created By: Demirhan Yalcin **Date:** 18/03/2026 **Environment:** Chrome 122, Windows 10, Desktop

Preconditions

User has access to the registration page.

Steps

1. Navigate to the registration page.
2. Enter an invalid email address into the email field, for example "demirhan@" or "notanemail".
3. Enter a valid password that meets all requirements including uppercase, lowercase, number and special character into the password field.
4. Click outside both fields or press Tab to trigger validation.
5. Observe the validation error messages appearing below each field.

Expected Result

Only the email validation error appears below the email field indicating the email address is invalid. The password field shows no validation error as the password input meets all requirements.

Actual Result

Both email and password validation errors appeared simultaneously even though the password input was valid and met all documented requirements.

Notes

Related bug report: Registration-002, Password validation error incorrectly triggers when only the email field contains invalid input. Also verify the reverse scenario where password is invalid and email is valid, to confirm validation errors are correctly isolated per field in both directions.
